

MIT700RE Pure Epoxy

Bonded anchor for use in concrete. The anchor is placed into a drilled hole filled with injection mortar. The steel element is anchored via the bond between metal part, injection mortar and concrete. The steel consists of a threaded rod, internal threaded rod or reinforcing bar.

1 SPECIFICATIONS OF INTENDED USE

Anchorage subject to:

- Static and quasi-static loads: M8 to M30, Rebar $\varnothing 8$ to $\varnothing 32$, MIG-M6 to MIG-M20
- Seismic action for Performance Category C1 and C2

Approvals:

- European Technical Assessment for Option 1
- European Technical Assessment for REBAR
- Fire resistance test certification F30-F120
- Fire resistance test certification REBAR
- Seismic performance category C1 and C2

Base materials:

- Reinforced or unreinforced cracked or non-cracked normal weight concrete strength classes C20/25 to C50/60 according to EN 206-1:2000 + A1:2016
- Dry or wet concrete and flooded bore holes (see ETA-19/0203 of 2nd December 2020)

Installation:

- Dry or wet concrete and flooded holes (not sea water)
- Hole drilling by hammer, hollow, compressed air or diamond drill mode
- Overhead installation allowed
- Anchor Installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site

Graphic installation guide for MIT700RE hollow drill bit, hammer, or compressed air drilling

- 1.1 Drilling the hole with hammer drill or compressed air drill. Automatic hole cleaning with HDB.
- 2.1 Compressed air cleaning (≥ 6 bar) can be used for all sizes. For HDB no cleaning required.
- 3 Prior to inserting the anchor rod into the filled bore hole, the position of the embedment depth shall be marked on the anchor rods. Inject mixture into the hole only when an even color is flowing. Start filling from the bottom of the hole to avoid air pockets.
- 4 Push fastener into the filled bore hole while turning slightly to ensure distribution of the mortar and remove possible closed in air. Tighten with a torque spanner to the predetermined value T_{inst} after complete curing of the mortar (see table).

Graphic installation guide for MIT700RE diamond drill

- 1.2 Drilling the hole with diamond drill.
- 2.2 Fill drill hole with water until water comes out, after that brush the drill hole then blow the hole with compressed air (≥ 6 bar)
3. Prior to inserting the anchor rod into the filled bore hole, the position of the embedment depth shall be marked on the anchor rods. Inject mixture into the hole only when an even color is flowing. Start filling from the bottom of the hole to avoid air pockets.
4. Push fastener into the filled bore hole while turning slightly to ensure distribution of the injection mortar and remove possible closed in air. Tighten with a torque spanner to the predetermined value T_{inst} after complete curing of the injection mortar (see table).

4 RECOMMENDED TENSION RESISTANCE

Basic performance data for MITRE700 Injection System in cracked and non-cracked concrete C20/25 for 50 years without influence of edge distance, spacing and splitting failure due to dimensions of the concrete member.

REQUIRED PROOFS FOR RECOMMENDED TENSION RESISTANCE:

For design tension resistance with chemical system MIT-SE Plus the minimum value for combined pull-out, concrete cone failure and steel failure needs to be considered:

For use in non-cracked concrete: $N_{rec,ucr} = \min(N_{rec,c,ucr}; N_{rec,s})$

For use in cracked concrete: $N_{rec,cr} = \min(N_{rec,c,cr}; N_{rec,s})$

* Concrete cone failure

Recommended tension resistance for steel failure ($N_{rec,s}$):

Internal Threaded Anchor Rod					MIG-M6	MIG-M8	MIG-M10
Steel class	Zinc Plated 5.8	$N_{rec,s}$	[kN]	4.76	8.10	13.81	
	Stainless steel A4-70	$N_{rec,s}$	[kN]	5.35	9.93	15.66	

Recommended tension resistance for steel failure ($N_{rec,s}$) can be applied for cracked or non-cracked concrete.

5 RECOMMENDED SHEAR RESISTANCE

Basic performance data for MITRE700 Injection System in cracked and non-cracked concrete C20/25 for 50 years without influence of edge distance, spacing and splitting failure due to dimensions of the concrete member.

REQUIRED PROOFS FOR RECOMMENDED SHEAR RESISTANCE:

For design shear resistance with chemical system MIT-SE Plus the minimum value for concrete pry-out failure and steel failure needs to be considered:

For use in non-cracked concrete: $V_{rec,ucr} = \min(V_{rec,cp,ucr}; V_{rec,s})$

For use in cracked concrete: $V_{rec,cr} = \min(V_{rec,cp,cr}; V_{rec,s})$

4 IMPORTANT NOTICE

For the design the complete technical assessment ETA-19/0203 of 2 December 2020 has to be considered. Values given above are only valid under the assumptions of sufficient cleaning and anchoring according to ETA-19/0203, Annex B4 – B8. Recommended resistance data in this document, do not consider the influence of edge distance, spacing and splitting failure due to limited dimensions of concrete member and in case of such influence, the above values should be reduced. In recommended resistance the partial safety factor as regulated in the ETA and partial safety factor of the load $\gamma_F = 1.4$ are considered. For combination of tensile loads, shear loads, bending moments as well as well as reduced edge distances or spacing's (anchor groups) see ETA or Mungo design software. The data above must be checked by the user under the responsibility of an engineer experienced in anchorage and concrete work. This is to ensure there are no errors and all data is complete and accurate and complies with all rules and regulations for the actual conditions and application.
